Mechanical testing of advanced fibre composites Dummy gauges are the preferred method for temperature compensation but, again, precise alignment is needed. It is necessary to mount the dummy gauges on an 'identical' piece of laminate, with the same orientation relative to the fibres as used for the active gauges.

Mechanical Testing of Composites. The objective of the mechanical testing of composite is the determination of mechanical parameters such as strength and stiffness that will be later used on the design of a composite structure. Referring to the classical laminate theory, 5 elastic properties (E_1 , E_2 , ν_{12} , ν_{23} and G_{12}) are necessary to calculate the elastic behaviour of a long fibre reinforced composite.

Attenuation test is the most important routine test for a fiber optic cable. Attenuation test are conducted by using OTDR according to IEC 60793-1-40C on finished fiber optic cables in fiber cable manufacturing industry. The equivalent EIA/TIA test method is TIA/EIA-455-61A or FOTP-61. There are some customers who insist to test attenuation on all the fibers in a fiber optic cable using the cut-back method.
