Ordinarily, relief valves do not have an accentuated huddling chamber nor a regulator ring for varying or adjusting blowdown. They therefore operate with a semi- modulating action in proportion to the system pressure.

A relief valve or pressure relief valve (PRV) is a type of safety valve used to control or limit the pressure in a system; pressure might otherwise build up and create a process upset, instrument or equipment failure, or fire. The pressure is

~~Relief valve - Wikipedia~~

There are two types of safety valves: spring-loaded safety valves and pilot operated safety valves. In a spring-

loaded safety valve, the closing force is generated by a helical spring. The set pressure is adjusted by pretensioning this spring with the adjusting screw. In the event of impermissible overpressures, the safety valve opens accordingly. Pilot operated safety valves (POSV) use the system pressure to
