Semtech SX1272/3 vs. SX1276/7/8/9. pySX127x is not entirely compatible with the 1272. The 1276 and 1272 chips are different and the interfaces not 100% identical. For example registers 0x26/27. But the pySX127x library should get you pretty far if you use it with care. Here are the two datasheets:

pyLoRa 0.3.1 - PyPI

Note that the SX1272 module runs at 3.3V and likely does not like 5V on its pins (though the datasheet is not say anything about this, and my transceiver did not obviously break after accidentally using 5V I/O for a few hours). To be safe, make sure to use a level shifter, or an Arduino running at 3.3V.

A DIY Low-cost LoRa gateway - univ-pau.fr

It has been tested with both SX1272 and SX1276 chips, using the Semtech SX1272 evaluation board and the HopeRF RFM92 and RFM95 boards (which supposedly contain an SX1272 and SX1276 chip respectively). This library contains a full LoRaWAN stack and is intended to drive these Transceivers directly.
